## 1. INTRODUCTION

Casitas Municipal Water District (CMWD or Casitas), in cooperation with the Ventura County Watershed Protection District (VCWPD) and the U.S. Geological Service (USGS), collects hydrology data on the Ventura River system. Figure 1-1 shows the watershed boundaries including drainage areas, stream gaging stations, and weather stations. The hydrology data is a valuable asset for developing an understanding of the water resources of the Ventura River system. Since 1981, CMWD has summarized the data into a series of annual reports. This report presents information and data for the 2020–2021 Water Year (WY 2021). Data is also presented for Calendar Year 2021 for comparison to historical data.

Casitas acquired the Ojai Water System in June 2017 which serves a population of 6,801 as of December 31, 2020. The main water source for this system is a wellfield which draws from the Ojai Valley Groundwater Basin, located within the San Antonio Creek Watershed, a sub-basin to the Ventura River Watershed. The Ojai Water System is supplemented by surface water deliveries from Casitas Reservoir (also referred to as Lake Casitas herein), particularly in times of drought and/or high demand when aquifers are typically depleted and well production is reduced or limited.

Ventura County experienced a major fire (the Thomas Fire) in WY 2018 which burned nearly the entire watershed, as shown in Figure 1-2. Hydrologic impacts from the Thomas Fire are subsiding with less impacts observed in WY 2021 than previous affected years.

Post-fire run-off deposited fine sediment in the stream channels which appears to have reduced streambed percolation, resulting in prolonged spring and summer time streamflow, and an increased duration of surface connection between the upper portions of the Ventura River watershed and the Pacific Ocean. Historically, Robles does not experience surface flow during the summer and fall in all but well above-average rainfall years. Surface flow was present at Robles since the first storm event following the Thomas Fire through June 10, 2021 when the flow reading reached 0 cfs through the facility. Minimal storm runoff occurred in 2020 and early 2021 which contributed to the end of flow through the facility, but it also indicates runoff conditions from the watershed are returning to pre-Thomas Fire conditions.

Streamflow monitoring was also impacted by the Thomas Fire as minimal scouring occurred in WY 2021 at Santa Ana/Coyote Creeks. Data from gaging stations continue to be impacted by heavy sediment loads deposited during post-fire storm events. Further discussion of the impacts and corrective actions taken is included in Section 2.2 herein.

Data from an additional rainfall station located on Ojai's East End and a San Antonio Creek gaging station are included in this report to reflect hydrologic conditions within the San Antonio Creek Watershed. Ojai Water System Sources and Deliveries are also included in this report.

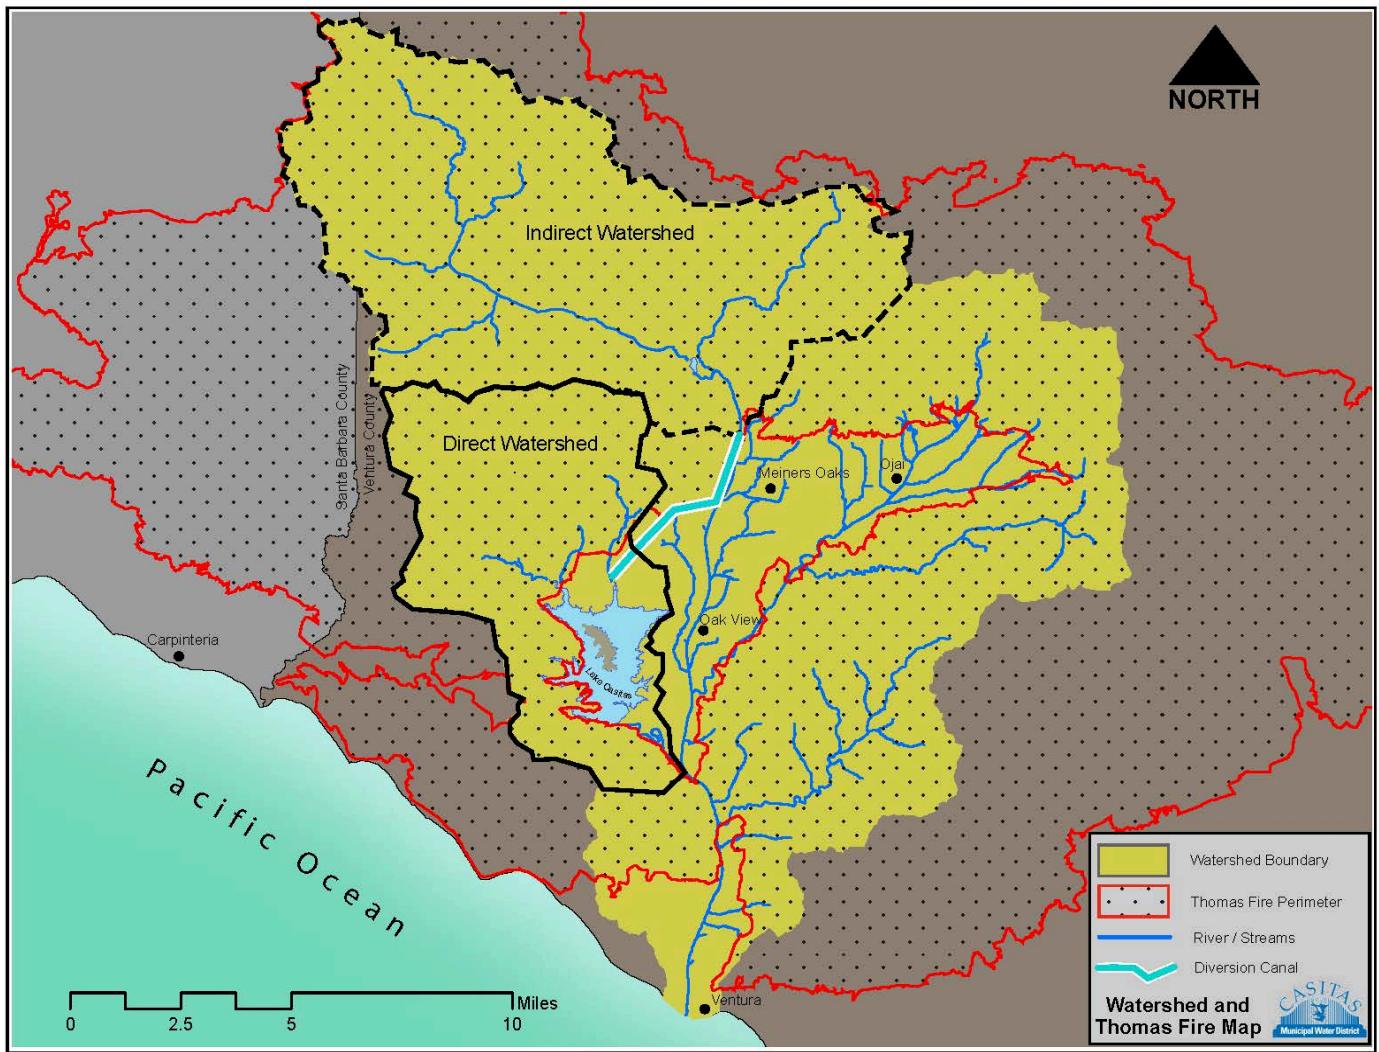

FIGURE 1-2 – Thomas Fire Boundary

## 2. WATER YEAR 2021 SUMMARY

The Water Year (WY) is a standard used for reporting hydrological cycles. It begins on October 1 of the preceding year and ends September 30 of the named water year. For this report:

- WY 2021 began on October 1, 2020 and ended September 30, 2021

There are four key elements of collected data evaluated this report: 1) rainfall, 2) streamflow conditions, 3) lake storage and system deliveries and 4) ambient air temperatures. Each of these elements are monitored and recorded by CMWD on a daily basis. The following subsections are summaries of the hydrologic characteristics of WY 2021.

### 2.1.Rainfall

Rainfall and evaporation data are collected on a daily basis by Casitas at two stations, one at the Casitas Dam and one at the Lake Casitas Recreational Area (LCRA). The methods for data collection are standardized for consistency. Rainfall data for Matilija Dam and Thacher School are obtained from VCWPD. Raw data is provided in Appendix A.

#### 2.1.1. WY 2021

The average of the four rainfall stations was 6.65 inches for WY 2021. This is below the long-term average of 23.83 inches. Casitas Dam received 7.07 inches while Matilija Dam received 6.48 inches.

The bulk of precipitation at Casitas Dam fell in the months of December, January, and March when cumulative monthly rainfall was 1.69, 3.99, and 1.29 inches, respectively. The highest daily rainfall was recorded on January 29, 2021 with 2.84 inches of rainfall measured at Casitas Dam.

### 2.2.Streamflow Conditions

Streamflow conditions are assessed by collecting data at key points in the Ventura River system. Gage station locations are shown in Figure 1-1. Mean daily stream flow data is included in Appendix B.

#### 2.2.1. WY 2021

Due to the ongoing drought, streamflow conditions were below average across the basin. Preliminary data provided by VCWPD indicates discharge from North Fork Matilija Creek totaled 875 acre-feet (AF) between October 1, 2020 and September 30, 2021. Discharge from Matilija Dam measured at the Matilija Hot Springs gage totaled 2,418 AF with a peak mean daily flow of approximately 29 cubic feet per second (cfs) on January 29, 2021<sup>1</sup>.

Surface flow at the measurement weir at Robles was present October 1, 2020 and continued through June 10, 2021 and then again from August 7 through August 11, 2021 due to a download from the Matilija Dam. During that period, 2,234 AF was released downstream<sup>2</sup>.

Diversions to the Casitas Reservoir began on January 28, 2020. Prior to January 28, all inflow was released downstream to allow for aquifer levels to rise to the extent that would be expected under natural conditions for the

---

<sup>1</sup> Matilija Dam measurement from data compiled by CMWD based on instantaneous readings shown as an average daily flow in Appendix B.

<sup>2</sup> Robles weir measurement from data compiled by CMWD based on instantaneous readings shown as an average daily flow in Appendix B.

time of year and type of year (*Trial Operating Criteria for Robles Casitas Diversion Facilities, 1959*). The diversion canal was operated for 4 days and 33 AF was diverted during WY 2021 as shown in Table 2-1<sup>3</sup>.

**Table 2-1  
WY 2021 Diversions**

Month	Days	Volume Diverted (AF)
October 2020	0	0
November 2020	0	0
December 2020	0	0
January 2021	3	31
February 2021	1	2
March 2021	0	0
April 2021	0	0
May 2021	0	0
June 2021	0	0
July 2021	0	0
August 2021	0	0
September 2021	0	0
<b>TOTAL</b>	<b>4</b>	<b>33</b>

There were no storm peaks that met the Biological Opinion parameters to initiate supplemental downstream releases for fish passage. All flow was released downstream when inflow was less than the required supplemental release.

Coyote Creek and Santa Ana Creek drainage areas contribute directly to Lake Casitas storage. Coyote Creek and to a lesser extent Santa Ana Creek gaging station continues to be impacted by sediment transport and re-channelization following the Thomas Fire, rendering poor quality flow data. Direct inflow into Lake Casitas, which is reported in the Casitas Reservoir Operation data (Appendix C), was used as a surrogate for Coyote and Santa Ana creeks as the major tributaries, but also accounts for other direct runoff including smaller tributaries such as Ayers, Chismahoo, Willow, and Poplin Creeks. Direct inflow is a zero sum calculation and accounts for change in Lake Casitas storage not accounted for by precipitation, Ventura River Diversions, evaporation, precipitation, and releases to the Marion Walker Water Treatment Plant. This value may be negative at times which is attributed to approximation in evaporation coefficients and water loss to infiltration. Only months with a positive direct inflow values are considered as a surrogate for true direct inflow into Lake Casitas and totaled 757 AF for WY 2021 with February 2021 accounting for 201 AF of total direct inflow as shown in Table 2-2<sup>4</sup>.

<sup>3</sup> Robles canal measurement from data compiled by CMWD based on instantaneous readings shown as an average in Appendix B.

<sup>4</sup> Direct inflow into Lake Casitas is shown in Appendix D.

**Table 2-2**

July 2021	N/A
August 2021	N/A
September 2021	101
<b>TOTAL</b>	<b>757</b>

### 2.3.Lake Storage and System Deliveries

Water storage volumes for system reservoirs, Casitas Dam and Matilija Dam, were ascertained by the daily recording of the reservoir elevation and applying the elevation number to a storage table for each reservoir. Casitas Reservoir data is included in Appendix C and Matilija Reservoir Data is provided in Appendix E. System delivery data for Mira Monte Well and the Ojai Water System can be found in Appendix F.

#### 2.3.1. WY 2021

Lake Casitas Reservoir had a net decrease in water storage for WY 2021. Lake elevation was 500.17 feet above mean sea level (MSL) on October 1, 2020 and ended on September 30, 2020 at 487.20 feet above MSL, corresponding to 79,683 AF of storage in Lake Casitas at the end of the WY. The reservoir's 12.97-foot decrease in elevation resulted in a net loss of 18,094 AF. Storage increased by 501 AF during a five day period of January; net monthly storage losses occurred outside of that period.

A new Casitas Reservoir storage rating table was adopted after completion of a LIDAR and bathymetric study resulting in a re-calculated reservoir capacity of 237,760 acre-feet (down from 254,000 acre-feet). This table was implemented on October 1, 2017 (start of WY 2018) and Casitas Reservoir storage reported from that date forward will reflect this adjustment.

Water deliveries from the reservoir to the main conveyance system totaled 12,468 AF for the Calendar Year. This is up 15 percent from 2020 and down 13 percent from the average deliveries during the previous ten years. Mira Monte well production was 219 AF during WY 2021. Deliveries within the Ojai Water System totaled 1,714 AF during WY 2021; 1,229 AF of which was sourced from the Ojai Water System Wellfield with the additional 484 AF coming from Lake Casitas.

---

<sup>5</sup> N/A indicates the month is not applicable because the value was negative.

Casitas did not exercise water rights to divert water released from Matilija Dam. At the request of the State of California Department of Water Resources Division of Safety of Dams (DSOD), the valves were operated in August 2021. Casitas conducted controlled releases from Matilija Dam at the dam on August 2-12 which totaled 0 AF of diversion at Robles.

## 2.4.Ambient Air Temperatures

Data was recorded by CMWD staff at two locations, Casitas Dam and LCRA. These measurements are made on a daily basis and include the maximum and minimum ambient air temperatures and wind speed. This data is included in Appendix G.

### 2.4.1. WY 2021

Two temperature records dating back to 1960 was broken during the 2021 calendar year: highest monthly maximums (January for Casitas Dam and Casitas Recreation Area).

## 3. HYDROLOGY STATIONS

Table 3-1 shows responsible agencies for various hydrology stations throughout the watershed.

**Table 3-1**  
**Hydrology Stations**

Type	Location	Agency
Reservoir	Casitas Dam	Casitas
Reservoir	Matilija Dam	VCWPD
Rainfall and Evaporation	LCRA	Casitas
Rainfall and Evaporation	Casitas Dam	Casitas
Rainfall	Matilija Dam	VCWPD
Rainfall	Thacher School	VCWPD
Streamflow	Matilija Creek at Matilija Hot Springs	Casitas/VCWPD
Streamflow	Ventura River Near Meiners Oaks	Casitas
Streamflow	Robles-Casitas Canal	Casitas
Streamflow	Ventura River near Ventura (Foster Park)	USGS
Streamflow	North Fork Matilija at Matilija Hot Springs	VCWPD
Streamflow	San Antonio Creek at Old Creek Road	VCWPD
Streamflow	Santa Ana Creek near Oak View	Casitas/VCWPD
Streamflow	Coyote Creek near Oak View	Casitas/VCWPD

### 3.1.Historical Hydrology Period 1959 through 2021

The historical data was updated for the reporting period and is presented in Figure 3-1 for the period from 1959 through 2021. The historical data includes summaries for the Casitas Reservoir operation, Robles Diversion, rainfall, and ambient air temperature. Storage volume, represented by a solid line, is reservoir storage at the start of each calendar year (elevation measured on last day of previous calendar year). Rainfall, represented by data points with

drop lines, is the three-station water year average for Casitas Dam, LCRA, and Matilija Dam rain gages. Reservoir volume prior to 1970 (not shown) represents initial filling period after Casitas Dam completion in 1959<sup>6</sup>.

The change in Casitas Reservoir capacity was made due to performance of a bathymetric survey in 2017 which decreased the previously used 254,000 AF to 237,760 AF. Calendar year 2021 provided a net decrease in the storage volume as shown in Figure 3-1.

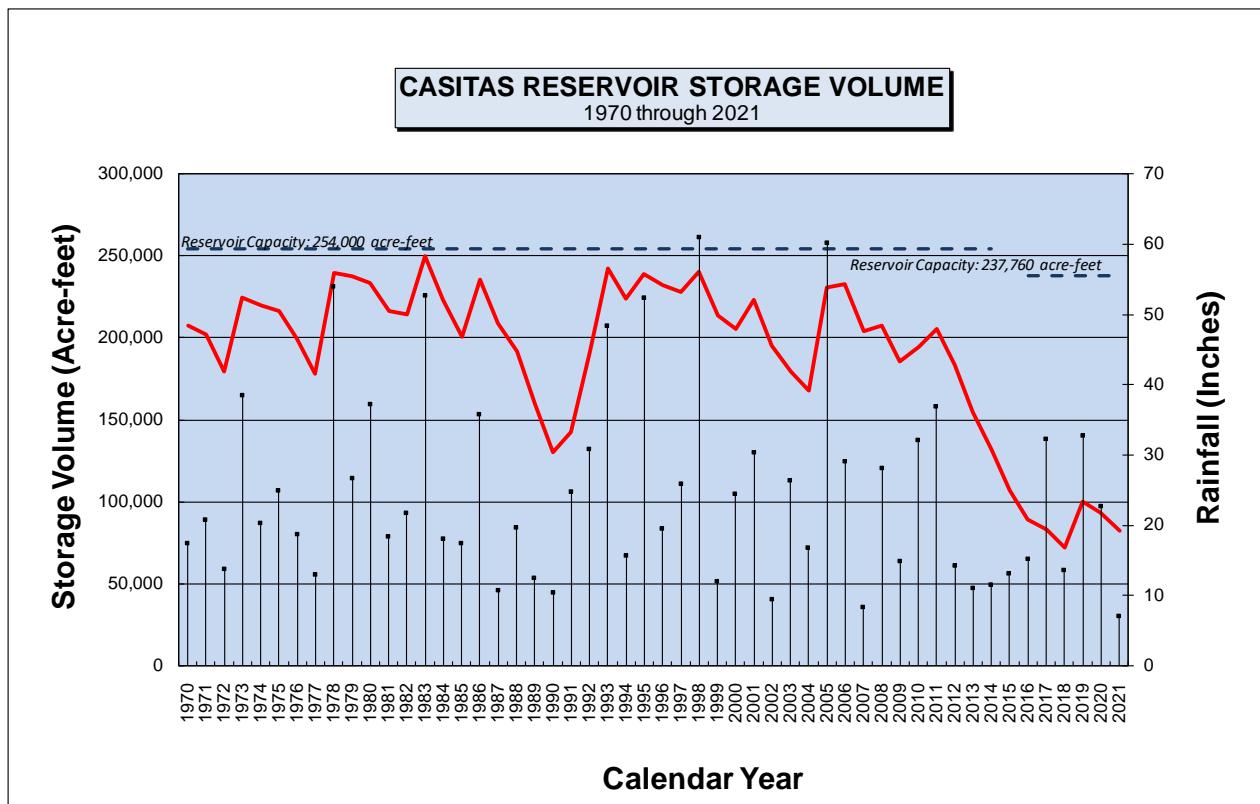

FIGURE 3-1 – Casitas Reservoir Storage Volume 1970-2021

### 3.2.Trends

The historical section of this summary report contains data tables and figures to illustrate trends experienced by CMWD pertaining to rainfall and water use.

#### 3.2.1. Ten-Year Moving Average of Mean Precipitation

The trend presented in Figure 3-2 is a ten-year moving average of precipitation from 1880 to present and was created by calculating an average of a water year's three-station average rainfall combined with the previous nine years. The ten-year moving average is represented by the solid line traversing across the overall average for the period (24.3 inches). Rainfall data for all three stations are available since 1959, rainfall prior to 1959 was assembled using comparable nearby stations and/or correlation factors with other available stations within the watershed. The

<sup>6</sup> Historical hydrology data is provided in Appendix H.

trend has resulted in what appears to be a somewhat sinusoidal curve, illustrating reoccurring periods of wet and dry conditions.

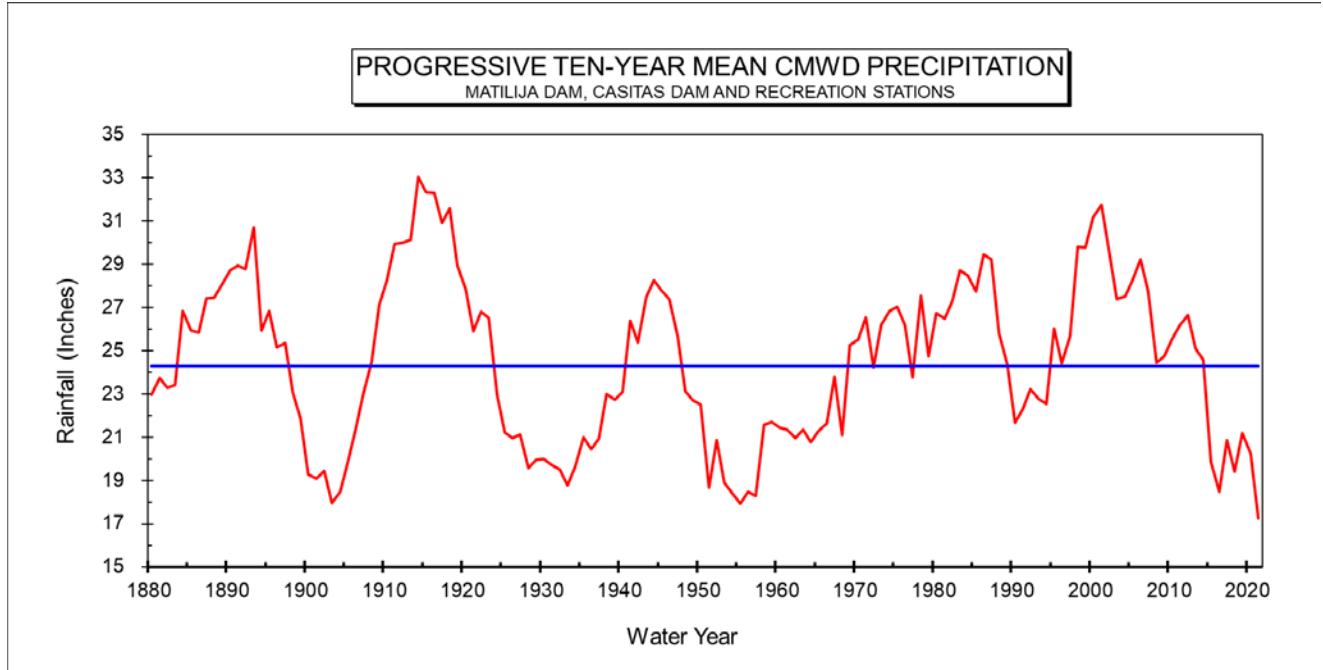

FIGURE 3-2 – Progressive Ten-Year Mean Precipitation

Reservoir capacity = 237,761 acre-feet at 567 ft. elevation.

Direct reservoir inflow values may be negative due to inaccuracies of the evaporation coefficients (supplied by the USBR)

Evaporation and precipitation readings taken at approximately 8 a.m.

Monthly Evaporation Coefficients: Jan=0.65, Feb=0.77, Mar=0.76, Apr=0.80, May=0.81, Jun=0.82, Jul= Aug=0.81, Sep=0.76, Oct=0.75, Nov=0.72, Dec=0.66

Reservoir capacity = 237,761 acre-feet at 567 ft. elevation.

e = estimate

Direct reservoir inflow values may be negative due to inaccuracies of the evaporation coefficients (supplied by the USBR)

Evaporation and precipitation readings taken at approximately 8 a.m.

Monthly Evaporation Coefficients: Jan=0.65, Feb=0.77, Mar=0.76, Apr=0.80, May=0.81, Jun=0.82, Jul= Aug=0.81, Sep=0.76, Oct=0.75, Nov=0.72, Dec=0.66
